

Midterm Project — Code Labs Briefs

Option C: Community Health Clinic Directory & Contact Platform

1. Project Overview & Scenario

Underserved populations and uninsured residents often struggle to identify free or low-cost medical services tailored to their specific needs. You will engineer an accessible clinic directory application that lets patients filter non-profit medical clinics by specialized services (e.g., Dental, Pediatrics, Mental Health), locate clinic hours/tags, and dynamically draft appointment requests without requiring a complex backend database.

2. Learning Objectives & Skill Alignment

- **HTML5:** Micro-layouts, semantic page layout, modal dialog structures (<dialog> or custom ARIA modals).
- **CSS3:** Grid and Flexbox for directory cards, state styling (:hover, :focus, :disabled), CSS animations for modals.
- **Vanilla JavaScript:**
 - Multi-criteria data filtering (combining search query + category tag filters).
 - Modal management (opening, closing via backdrop click or Escape key, keyboard focus trapping).
 - Dynamic form population based on user selection.
- **Git & Web Hosting:** Deployment via Vercel or GitHub Pages.

3. Core Requirements & Features

Feature 1: Searchable Medical Services Directory

- **UI Structure:** Search bar paired with service category tag buttons (General Practice, Dental, Pediatrics, Mental Health, Vision).
- **Functionality:**
 - Real-time text search filtering clinics by name, address, or service offered as the user types.
 - Active tag filtering allowing multi-select or single-select service filtering.
 - Empty state handling: Display a friendly message when no clinics match the search criteria.

Feature 2: Dynamic Clinic Details & Location Tags

- **UI Structure:** Clinic cards displaying status badges (Open Now, Accepting New Patients, Walk-ins Welcome), location district, and contact details.
- **Functionality:**
 - Filter clinics based on location district (Downtown, North District, Mobile Clinic Units).
 - Toggle between "Card View" and "Compact List View" using JavaScript DOM style/class manipulation.

Feature 3: Dynamic Appointment Request Modal

- **UI Structure:** An "Appointment Request" button on each clinic card that opens an interactive modal window.
- **Functionality:**
 - Auto-populate the selected clinic's name and ID inside the modal form dynamically upon opening.
 - Form inputs for Patient Name, Contact Preference (Email/Phone), Preferred Date/Time, and Service Requested.
 - Display a success message confirming the request preview and save the request history to localStorage.

4. Technical Constraints & Submission

- **No External Frameworks:** Pure HTML5, CSS3, and Vanilla JS.
- **Deployment:** Must be hosted live on GitHub Pages or Vercel.
- **Video Walkthrough:** 3 to 5-minute video detailing code structure, search filtering logic, and modal DOM manipulation.

5. Evaluation Rubric

Criteria	Weight	Requirements
HTML Structure & Accessibility	25%	Semantic tags, proper ARIA attributes on modals and dynamic filter buttons.
CSS Layout & View Modes	25%	Mobile-first design, seamless transitions between Card and List views using CSS.
JS Search & Modal Logic	35%	Real-time live search, tag filtering, dynamic modal population, localStorage integration.
Git & Deployment	10%	Version-controlled Git repository, working deployment link on GitHub Pages/Vercel.
Video Walkthrough	5%	Concise walkthrough showing search, filter, and modal interaction.
